C O M P A N Y

Our company offers manufacturing services, attracting scores of industries including food, chemistry, textile and agriculture with reliance on an experience team and an R&D department using UV-stabilized linear low density polyethylene raw material (LLDPE) imported from top global petrochemical companies that offer top-quality products along with technology-driven automation machines and rotation and inflation techniques.

Expanding its product range with years of experience in manufacturing polyethylene materials, we manufacture products for various industries such as water tanks, chemical tanks and maritime goods, along with mixers and mixing tanks, silos, food tanks, food silos, textile transportation trolleys, traction and thread buckets, floating pier systems, yacht/jetski platform, fish farm brackets, fuel tanks, waste water tanks, dosage tanks, decomposition and sedimentation tanks, acid tanks, on-board shipping and transportation tanks, and pest control tanks. In addition, polyethylene plates allow manufacturing tanks in any size relying on resource management. They are largely used in coating concrete shear reservoirs and manufacturing tanks with the involvement of acid as an agent. Polyethylene processing technologies are superior to other plastic processing technologies in terms of mold design and production and cost. Polidaş offers flexible manufacturing techniques that allow quickly responding to needs with high quality and affordability.
