

The Challenge of Making a Simple Product

Since 2025, we've been working to create a unique and user-friendly line storage system—not just another rope hook, but a solution that keeps lines secure in all sailing conditions.

Our **Line Fix** products were designed to be self-locking, operable with one hand, and capable of holding lines of any thickness safely in place—no matter what.

We received many pre-orders from international retailers and distributors. We dreamed of launching in April 2025. But transitioning from 3D printing to mass production through state of the art injection molding tools proved to be a major challenge. The first 18 toolmakers turned us down, calling the project technically impossible. It wasn't until the 19th took on the task—and after nine rounds of tool adjustments and a €200,000 investment—that production finally began in July 2026.

Though **Line Fix** and **Line Fix Mini** may look simple, they required extremely tight tolerances and advanced production tools. Now, we're ready with the most reliable line storage system sailors have ever seen.
